

### KPI 9.17 Interior and Exterior Angles

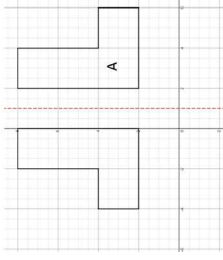

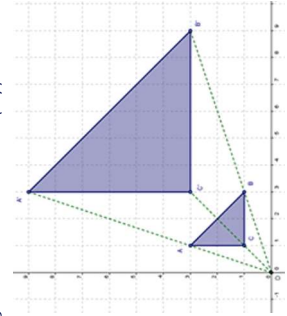

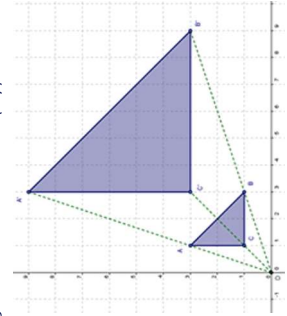

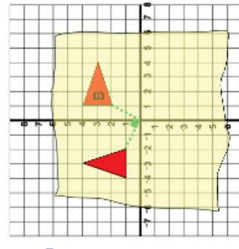

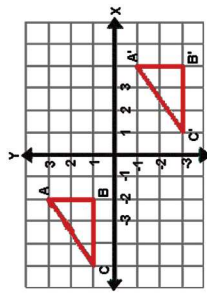

<b>1) Polygon</b>	A polygon is a two-dimensional shape with 3 or more straight sides. A polygon is either regular or irregular: Regular – side lengths are equal, and all angles are equal. Irregular – side lengths are unequal, and angles are unequal.	
<b>2) 3 sides</b>	Triangle	<b>3) 4 sides</b> Quadrilateral
<b>4) 5 sides</b>	Pentagon	<b>5) 6 sides</b> Hexagon
<b>6) 7 sides</b>	Heptagon	<b>7) 8 sides</b> Octagon
<b>8) 9 sides</b>	Nonagon	<b>9) 10 sides</b> Decagon
<b>10) 11 sides</b>	Hendecagon	<b>11) 12 sides</b> Dodecagon
<b>12) Exterior Angles</b>	Exterior angles of polygons sum to $360^\circ$ . An exterior angle of a regular polygon is found by calculating $\frac{360}{n}$ , n is the number of sides.	
<b>14) Tessellation</b>	A pattern created with identical shapes that fit together with no gaps.	

### KPI 9.18 Parallel Lines

<b>1) Alternate angles</b>	Alternate angles are equal, so $a = b$ 	<b>2) Corresponding angles</b> 
<b>3) Vertically opposite angles</b>	Vertically opposite angles are equal, so, $a = b$ and $c = d$ 	<b>4) Co-interior angles</b> Co-interior angles sum to $180^\circ$ , so $a + b = 180^\circ$ 

KPI 9.19 Basic Vectors

<p>1) <b>Vector</b></p>	<p>Vectors represent movement of a certain size in a certain direction, they are represented on a diagram with an arrow.</p>	
<p>2) <b>Magnitude</b></p>	<p>Magnitude is defined as the length of a vector.</p>	<p><b>3) Scalar</b></p> <p>A scalar is the number we multiply a vector by.</p>
<p>4) <b>Column vector</b></p>	$\begin{pmatrix} a \\ b \end{pmatrix}$	<p><i>a</i>: movement along the x-axis (left/right) <i>b</i>: movement along the y-axis (up/down)</p>
<p>5) <b>Adding and subtracting column vectors</b></p>	$\begin{pmatrix} a \\ b \end{pmatrix} + \begin{pmatrix} c \\ d \end{pmatrix} = \begin{pmatrix} a + c \\ b + d \end{pmatrix}$	<p><b>6) Multiplying vectors</b></p> <p>To multiply a column vector by a number, we multiply both values in the vector by that number.</p>
<p>7) <b>Resultant vectors</b></p>	<p>The resultant vector is the vector that results from adding two or more vectors together.</p>	
<p>8) <b>Parallel vectors</b></p>	<p>Travel in the same or opposite direction. Can be of varying lengths. Must be scalar multiples of one another.</p>	<p>The vectors <math>\begin{pmatrix} 8 \\ 12 \end{pmatrix}</math> and <math>\begin{pmatrix} 2 \\ 3 \end{pmatrix}</math> are parallel because <math>\begin{pmatrix} 8 \\ 12 \end{pmatrix} = 4 \begin{pmatrix} 2 \\ 3 \end{pmatrix}</math></p>

KPI 9.20 Transformations	
<p><b>1) Transformations</b></p>	<p>There are four types of transformations</p> <p>Reflection Rotation Enlargement Translation</p>
<p><b>3) Image</b></p>	<p>This is the new shape created as the result of the transformation.</p> <p>A shape is reflected in a line of symmetry. When a shape is reflected the image is always congruent to the object. The line of symmetry used must be given/or found using an equation. An object and its image are always the same perpendicular distance from the line of symmetry. E.g. Reflect shape A in the line <math>x=1</math></p> 
<p><b>5) Reflection</b></p>	<p>When enlarging a shape we must have two pieces of information.</p> <p>Centre of enlargement given as a coordinate (x,y) Scale factor</p> 
<p><b>7) Enlargement</b></p>	<p>When enlarging a shape we must have two pieces of information.</p> <p>Centre of enlargement given as a coordinate (x,y) Scale factor</p> 
<p><b>2) Object</b></p>	<p>This is the original shape used to perform the transformation on</p>
<p><b>4) Congruent</b></p>	<p>Two (or more) shapes that are the same size and the same shape.</p> <p>When rotating a shape we must have 3 pieces of information.</p> <p>Centre of rotation given as a coordinate (x,y) Angle of rotation (usually 90°, 180°, 270°) Direction (clockwise or anticlockwise)</p> 
<p><b>6) Rotation</b></p>	<p>A translation is a movement of an object When a shape in translated the image is congruent to the object. Translations are described using column vectors (a ; b) a: movement along the x-axis (left or right) b: movement along the y-axis (up or down)</p> <p>E.g. Translate the original triangle ABC by the vector (6 ; -4)</p> 
<p><b>8) Translation</b></p>	<p>A translation is a movement of an object When a shape in translated the image is congruent to the object. Translations are described using column vectors (a ; b) a: movement along the x-axis (left or right) b: movement along the y-axis (up or down)</p> <p>E.g. Translate the original triangle ABC by the vector (6 ; -4)</p>
